

Ecommerce Order Analytics

Exploratory data analysis for Project 2 | Built from 1,200 transaction records

Total order value	Orders	Avg order	Operational leakage
\$1,264,762	1,200	\$1,054	\$519,674

The story is not just that the store has demand. The stronger investor point is that demand is diversified across products and channels, while the largest upside sits in reducing returned and cancelled order value.

Where growth is coming from

Chair leads product value and Instagram is the strongest source.

The product mix is healthy: no single product carries the whole business. That gives management room to optimize bundles, campaigns, and service quality without betting everything on one SKU.

Trend signal

Best month: 2024-06 at \$68,069; latest month improved 22.2% month over month.

The monthly series is uneven, but the final observed month shows renewed momentum. That is the right place to frame the next commercial question: what changed, and can it be repeated deliberately?

The investor-ready opportunity

The biggest lever is not finding demand. It is protecting the value already being created.

Opportunity	Evidence	Move
Reduce operational leakage	\$519,674 tied to returned/cancelled orders	Audit descriptions, delivery promise, and customer support loops
Scale high-quality channels	Instagram leads at \$275,285	Shift test budget toward high-AOV sources
Retain large baskets	8 outlier orders above \$3,330	Create a VIP follow-up workflow
Broaden winning assortment	Chair leads but revenue is spread	Package complementary products into bundles

Bottom line: this dataset can support a credible early ecommerce story, provided the next phase validates why cancellations and returns are happening and proves that high-value order behavior can be repeated.
